

A METHOD FOR SYNCHRONIZING RASTER AND VECTOR MAP IMAGES

ABSTRACT OF THE DISCLOSURE

5 A system and method for coordinated manipulation of multiple
displayed maps, even when the maps use different internal coordinate
systems. According to this embodiment, each map image to be displayed is
first georeferenced, to provide a set of conversion functions between each
map's internal coordinate system and a geographic coordinate system, which
is latitude/longitude in the preferred embodiment. After this is done, any
10 point on each map can be referenced using the geographic coordinate set.
Since this is the case, the maps can now be manipulated, edited, and
annotated in a synchronized manner, by defining the manipulations in terms
of the geographic coordinate system, and using the georeferencing functions
to translate the manipulation to each map's internal coordinate system.
